

1        1.        A method of providing multiple program identifier (PID) information for a  
2        multiple carriage content delivery system, comprising:

3                constructing a program association table (PAT) that associates programs  
4        with primary PIDs;

5                constructing a plurality of program map tables (PMT), one for each program  
6        in the PAT;

7                constructing a lookup table that maps at least one primary PID to at least  
8        one shadow PID; and

9                broadcasting the PAT, the PMTs and the lookup table over the content  
10       delivery medium.

11  
12       2.       The method according to claim 1, wherein the lookup table is broadcast as  
13       one or more MPEG user private data packets.

14  
15       3.       The method according to claim 1, carried out at a cable television system  
16       headend.

- 1        4.     A method of demultiplexing a data stream having multiple program  
2        identifiers for a program, comprising:  
3            receiving a program association table (PAT) that associates programs with  
4        primary PIDs;  
5            receiving a program map table (PMT);  
6            receiving a lookup table relating primary PIDs to shadow PIDs;  
7            determining, from the PMT and the lookup table that a program is associated  
8        with both a primary PID and a shadow PID; and  
9            setting a PID filter to permit passage of packets having both primary and  
10       shadow PIDs.  
11  
12       5.     The method according to claim 4, further comprising establishing a  
13       demultiplexer output path for both the primary PID and the shadow PID.  
14  
15       6.     The method according to claim 4, wherein the lookup table contains a  
16       shadow PID for a shadow entitlement control message (ECM), and further  
17       comprising initializing a decrypter using the shadow ECM.  
18  
19       7.     The method according to claim 4, carried out in a television set-top box.  
20  
21

1 8. A method of constructing a stream of data packets having primary and  
2 shadow packet identifiers (PIDs), the packets having headers and payloads,  
3 comprising:

4 receiving an incoming data stream having packets with the primary and  
5 shadow PIDs;

6 providing a stream of packets having the primary PID to a first buffer;

7 detecting a packet having the shadow PID and a shadow payload in the  
8 incoming data stream;

9 switching the stream of packets having the primary PID to a second buffer  
10 in response to the detecting; and

11 searching a last packet stored in the first buffer for a packet corresponding  
12 to the packet having the shadow PID.

13  
14 9. The method according to claim 8, further comprising generating an interrupt  
15 as a result of detecting the packet having the shadow PID.

16  
17 10. The method according to claim 9, wherein the switching is carried out in  
18 response to the interrupt.

19  
20 11. The method according to claim 8, further comprising generating a packet  
21 having the primary PID and the shadow payload.

22  
23 12. The method according to claim 11, wherein the generating comprises  
24 substituting the primary PID for the shadow PID into the packet having the shadow  
25 PID.

26  
27 13. The method according to claim 11, wherein the generating comprises  
28 substituting the shadow payload into the matching packet.  
29

1 14. The method according to claim 8, wherein the corresponding packets have  
2 the matching sequence number.

3  
4 15. The method according to claim 8, wherein the corresponding packets are  
5 encrypted under two different encryption techniques.

6  
7 16. A storage medium storing instructions which, when executed on a  
8 programmed processor, carry out a process according to claim 8.

1 17. A method of constructing a stream of data packets having primary and  
2 shadow packet identifiers (PIDs), the packets having headers and payloads,  
3 comprising:

4 receiving an incoming data stream having packets with the primary and  
5 shadow PIDs;

6 providing a stream of packets having the primary PID to a first buffer;

7 detecting a packet having the shadow PID and a shadow payload in the  
8 incoming data stream;

9 switching the stream of packets having the primary PID to a second buffer  
10 in response to the detecting; and

11 searching a first packet stored in the second buffer for a packet  
12 corresponding to the packet having the shadow PID.

13  
14 18. The method according to claim 17, further comprising generating an interrupt  
15 as a result of detecting the packet having the shadow PID.

16  
17 19. The method according to claim 18, wherein the switching is carried out in  
18 response to the interrupt.

19  
20 20. The method according to claim 17, further comprising generating a packet  
21 having the primary PID and the shadow payload.

22  
23 21. The method according to claim 20, wherein the generating comprises  
24 substituting the primary PID for the shadow PID into the packet having the shadow  
25 PID.

26  
27 22. The method according to claim 20, wherein the generating comprises  
28 substituting the shadow payload into the matching packet.  
29

1        23.    The method according to claim 17, wherein the corresponding packets have  
2        the matching sequence number.

3  
4        24.    The method according to claim 17, wherein the corresponding packets are  
5        encrypted under two different encryption techniques.

6  
7        25.    An electronic storage medium storing instructions which, when executed on  
8        a programmed processor, carry out a process according to claim 17.

1 26. A method of constructing a stream of data packets having primary and  
2 shadow packet identifiers (PIDs), the packets having headers and payloads,  
3 comprising:

4 receiving an incoming data stream having packets with the primary and  
5 shadow PIDs;

6 providing a stream of packets having the primary PID to a first buffer;

7 detecting a packet having the shadow PID and a shadow payload in the  
8 incoming data stream;

9 switching the stream of packets having the primary PID to a second buffer  
10 in response to the detecting; and

11 searching a first packet stored in the second buffer and a last packet stored  
12 in the first buffer for a packet corresponding to the packet having the shadow PID.

13  
14 27. The method according to claim 26, further comprising generating an interrupt  
15 as a result of detecting the packet having the shadow PID.

16  
17 28. The method according to claim 27, wherein the switching is carried out in  
18 response to the interrupt.

19  
20 29. The method according to claim 26, further comprising generating a packet  
21 having the primary PID and the shadow payload.

22  
23 30. The method according to claim 29, wherein the generating comprises  
24 substituting the primary PID for the shadow PID into the packet having the shadow  
25 PID.

26  
27 31. The method according to claim 29, wherein the generating comprises  
28 substituting the shadow payload into the matching packet.  
29

1 32. The method according to claim 26, wherein the corresponding packets have  
2 the matching sequence number.

3  
4 33. The method according to claim 26, wherein the corresponding packets are  
5 encrypted under two different encryption techniques.

6  
7 34. An electronic storage medium storing instructions which, when executed on  
8 a programmed processor, carry out a process according to claim 26.

1 35. A method of constructing a stream of data packets having primary and  
2 shadow packet identifiers (PIDs), the packets having headers and payloads,  
3 comprising:

4 receiving an incoming data stream having packets with the primary and  
5 shadow PIDs;

6 providing a stream of packets having the primary PID to a first buffer;

7 detecting a packet having the shadow PID and a shadow payload in the  
8 incoming data stream;

9 switching the stream of packets having the primary PID to a second buffer  
10 in response to the detecting;

11 determining a memory address for a storage location in the first buffer at a  
12 time of the detecting; and

13 searching for a packet stored at approximately the memory address in the  
14 first buffer for a packet corresponding to the packet having the shadow PID.

15  
16 36. The method according to claim 35, further comprising generating an interrupt  
17 as a result of detecting the packet having the shadow PID.

18  
19 37. The method according to claim 36, wherein the determining is carried out  
20 in response to the interrupt and wherein the determining comprises storing  
21 contents of a DMA register to note temporal location for packets.

22  
23 38. The method according to claim 35, further comprising generating a packet  
24 having the primary PID and the shadow payload.

25  
26 39. The method according to claim 38, wherein the generating comprises  
27 substituting the primary PID for the shadow PID into the packet having the shadow  
28 PID.  
29

1 40. The method according to claim 38, wherein the generating comprises  
2 substituting the shadow payload into the matching packet.

3  
4 41. The method according to claim 35, wherein the corresponding packets have  
5 the matching sequence number.

6  
7 42. The method according to claim 35, wherein the corresponding packets are  
8 encrypted under two different encryption techniques.

9  
10 43. An electronic storage medium storing instructions which, when executed on  
11 a programmed processor, carry out a process according to claim 35.

1 44. A digital television receiver apparatus that reconstitutes/reconstructs a  
2 stream of data packets having primary and shadow packet identifiers (PIDs), the  
3 packets having headers and payloads, the receiver comprising:

4 a micro computer;

5 a first primary packet buffer;

6 a second primary packet buffer;

7 a demultiplexer receiving an incoming data stream having packets with the  
8 primary and shadow PIDs and providing a stream of packets having the primary  
9 PID to one of the toggled primary packet buffers;

10 means for detecting a packet having the shadow PID and a shadow payload  
11 in the incoming data stream;

12 an interrupt handler that generates an interrupt as a result of detecting the  
13 packet having the shadow PID;

14 means for toggling the stream of packets having the primary PID to the other  
15 of the first and second primary packet buffers in response to the interrupt; and

16 program means running on the microcomputer for identifying a location of  
17 a packet adjacent the detected packet at least one of the first and second primary  
18 packet buffers.  
19

20 45. The apparatus according to claim 44, further comprising program means  
21 running on the micro computer for generating a packet having the primary PID and  
22 the shadow payload.  
23

24 46. The apparatus according to claim 45, wherein the generating comprises  
25 substituting the primary PID for the shadow PID into the packet having the shadow  
26 PID.  
27

28 47. The apparatus according to claim 45, wherein the generating comprises  
29 substituting the shadow payload into the matching packet.  
30

1 48. The apparatus according to claim 44 wherein the corresponding packets  
2 have the matching sequence number.

3  
4 49. The apparatus according to claim 44, wherein the corresponding packets are  
5 encrypted under two different encryption techniques.

6  
7 50. The apparatus according to claim 44, wherein the program means  
8 comprises means for reading a DMA register.

9  
10 51. The apparatus according to claim 44, wherein the digital television receiver  
11 device comprises a television set-top box.
